AirSAR and GeoSAR

Instrument	Frequency band	Bandwidth (MHz)	Band length (cm)	Single-look range resolution (m)	Polarizations	Interferometric	Pixel size in this study, after orthorectification and post-processing
AIRSAR	P	20	68	7.5	HH, VV, HV, VH	No	5,5
AIRSAR	L	40, 80	25	3.7, 1.8	HH, VV, HV, VH	Yes	5,5
AIRSAR	C	40	5.7	3.7	HH, VV, HV, VH	Yes	5,5
GeoSAR Too Notched	P	160 (max)	86	0.9	HH, HV or VV & VH	Yes	N/A
GeoSAR	X	160	3	0.9	VV	Yes	3,3 DEM 5,5 Image

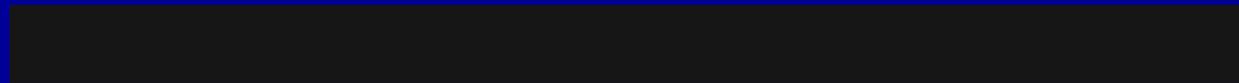

Ran tests of statistical association with archaeological sites for all bands and polarizations

PVV

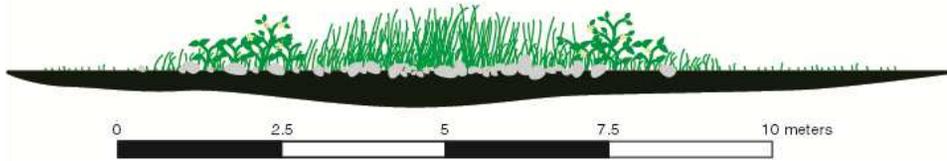

**75cm long, not affected by
vegetation and small rocks**

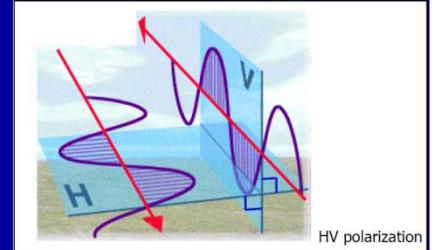

Organic soils, more moisture than surrounding soils

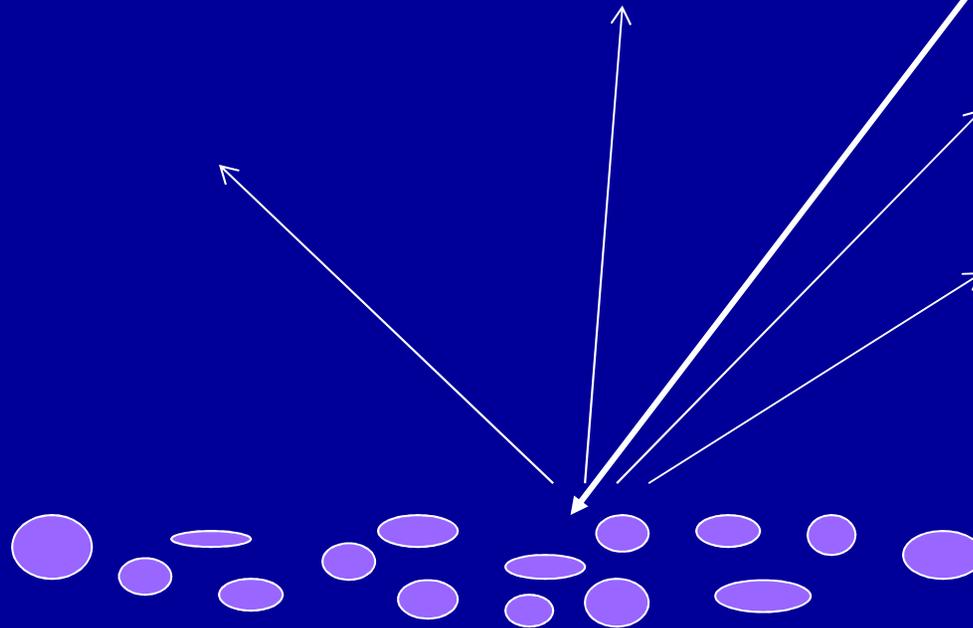

Typical Archeological Site
San Clemente Island

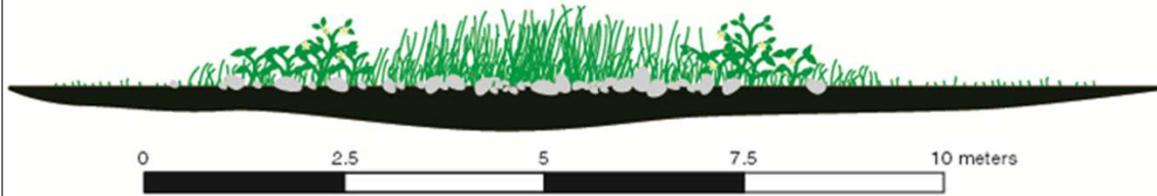

LHH

**25cm long, not affected much by
vertical vegetation structure, scattered by small rocks**

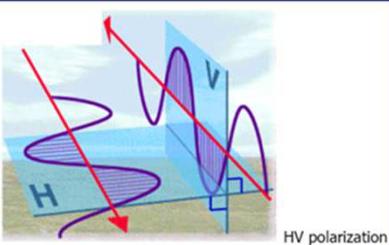

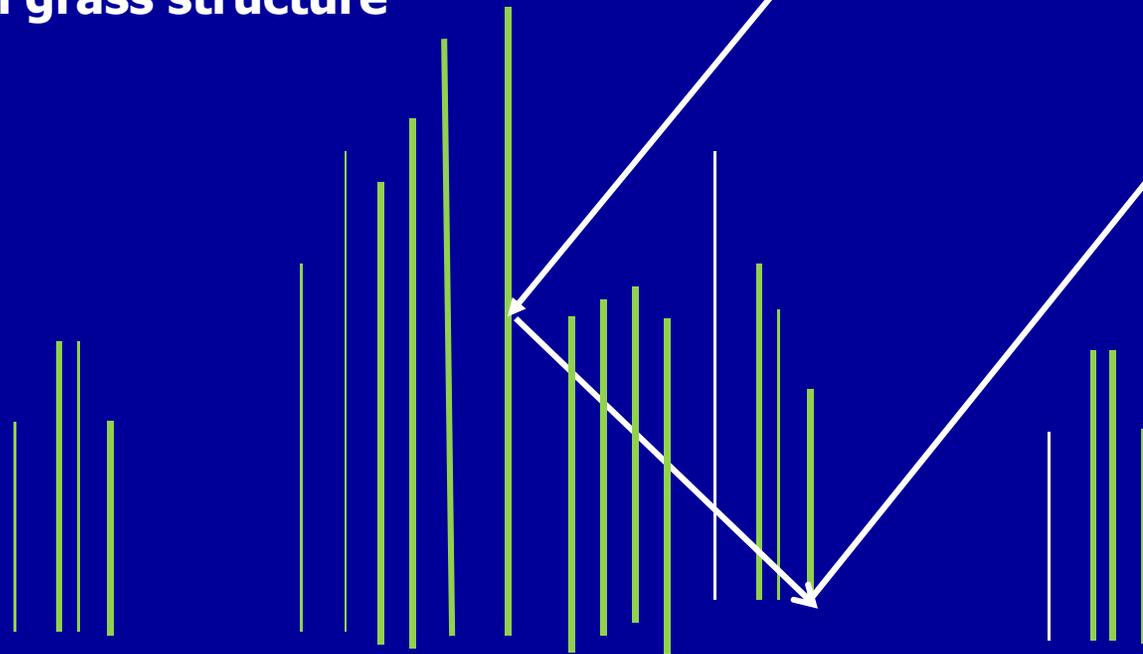

Typical Archeological Site
San Clemente Island

CVV

**5cm long, double-bounce from
vertical grass structure**

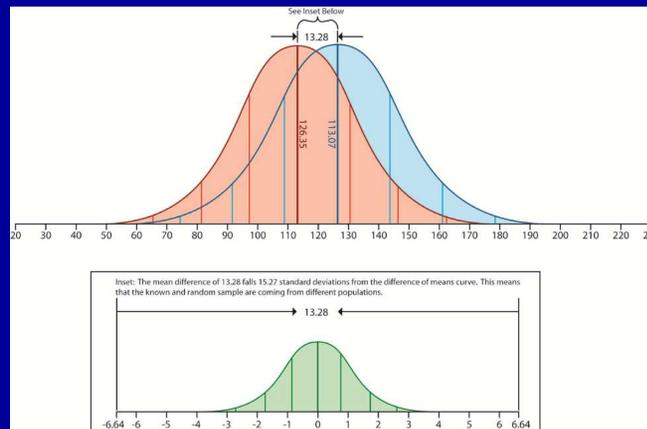

HV polarization

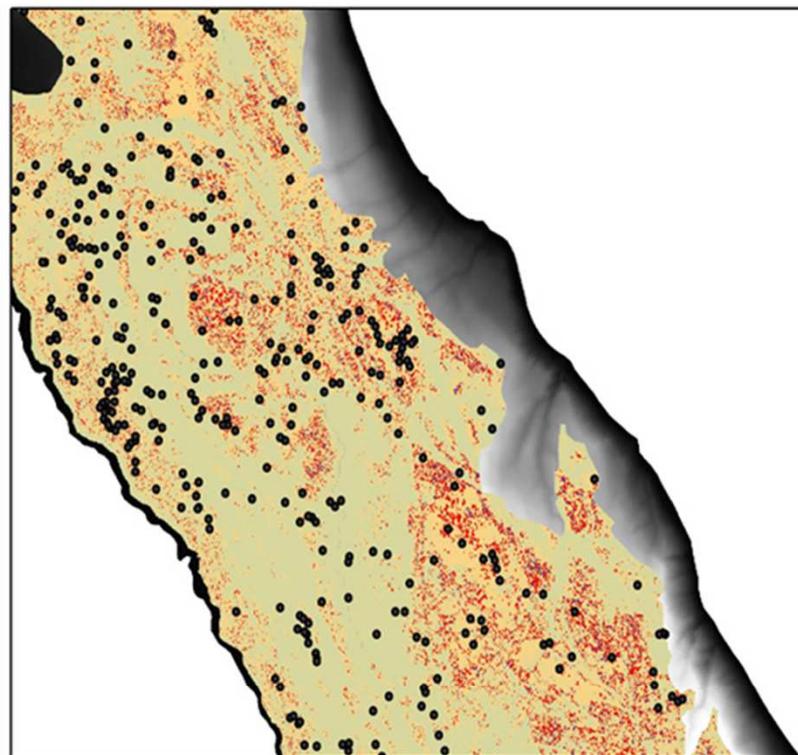

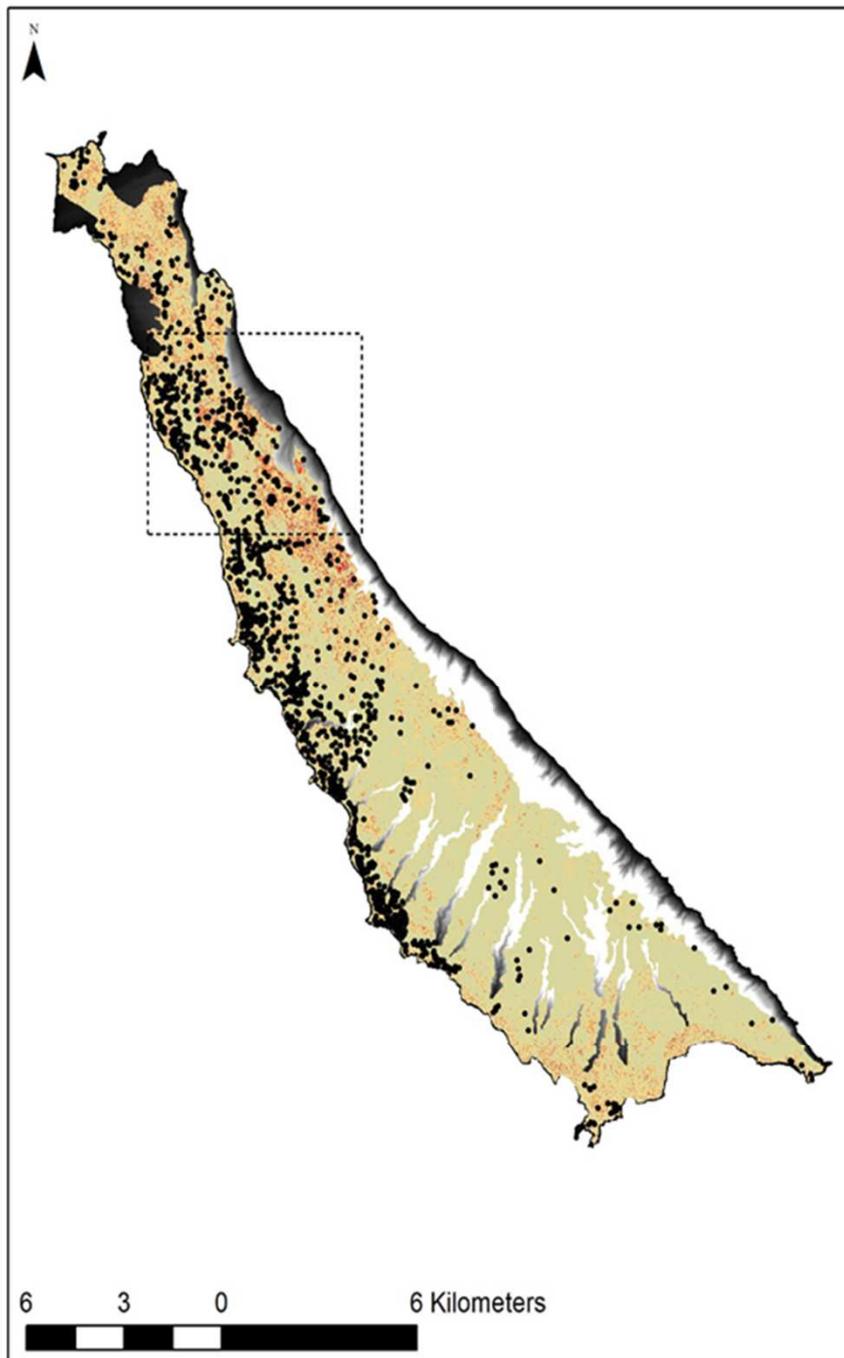

Testing the Null Hypothesis:

$$H_0 : \bar{x}_1 = \bar{x}_2$$

The null hypothesis is that the two sets of samples are drawn from the same universe of values. If so, the difference between the means of the two samples will be less than 1.96 standard deviations of the difference of the means. Or:

$$\left(\sum_n^1 x_1 / n \right) - \left(\sum_n^1 x_2 / n \right) < 1.96 \sqrt{\sigma_1 / n + \sigma_2 / n}$$

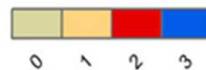

Model showing the number of datasets statistically associated with archaeological sites on San Clemente Island, and known archaeological sites. Datasets include PVV, CVV and LHH. Overlaid here are the locations of archaeological sites as determined by 100% survey of accessible land of the island

Enhancements

Machine learning

Terrain-based archaeological predictive models

Cross-validate

Diagrammatic Representation of our New Protocol

1. Images of raw data or corrected data not further binned

2 a. Harvests numbers from pixels, 2 b. Uses annuli method

3. Using principal component analysis (could use other approaches)

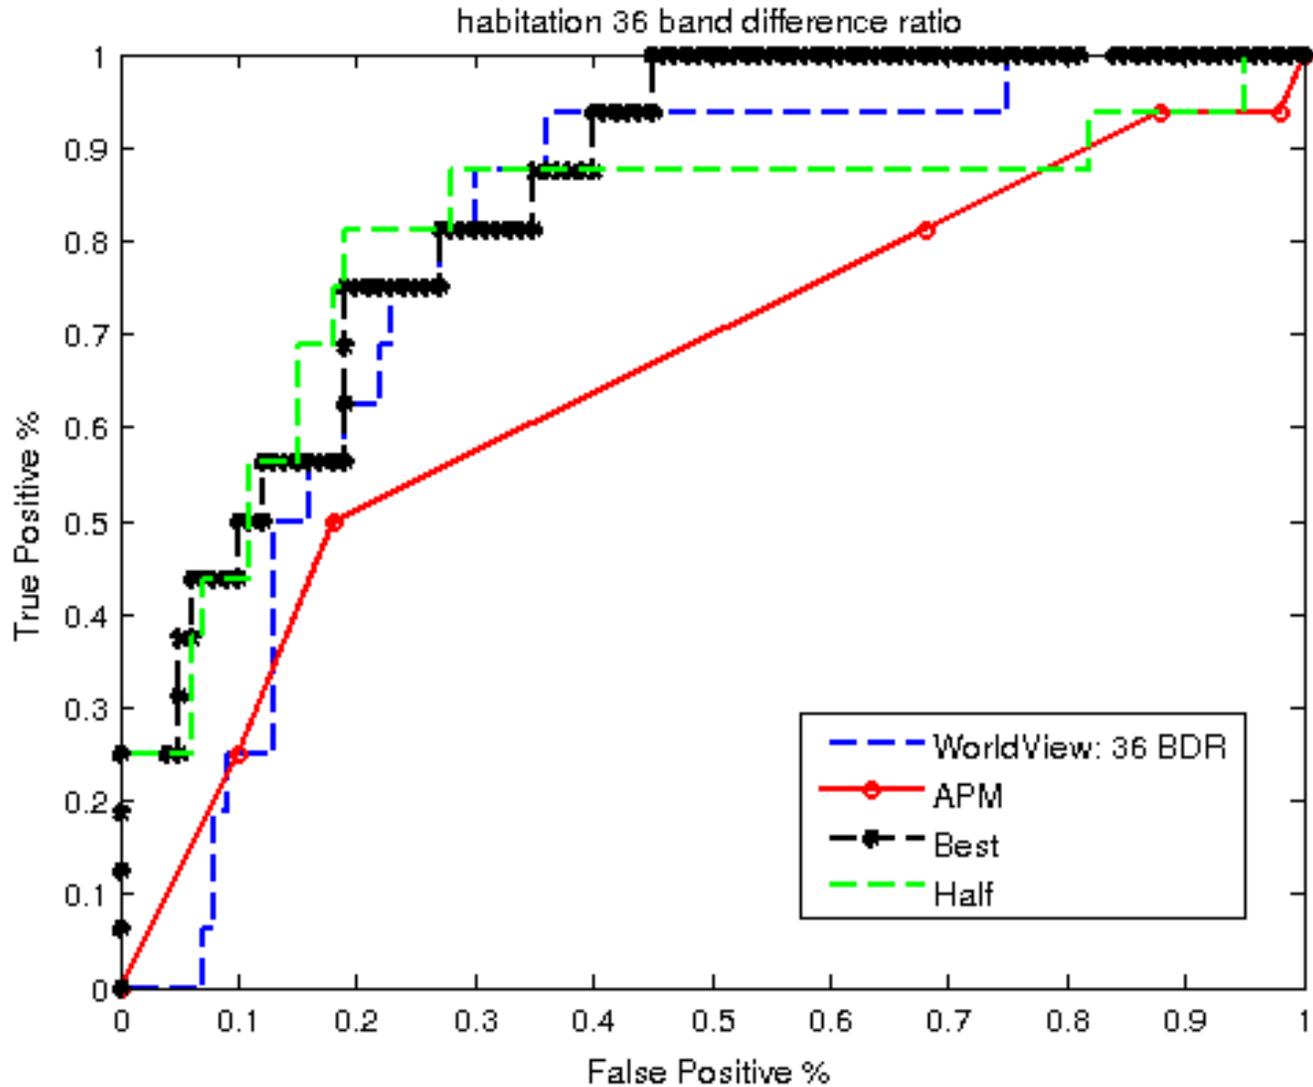

4. Using linear discriminate analysis (could use others)

Interferometric Analysis of C and X-Bands

SAR for Context

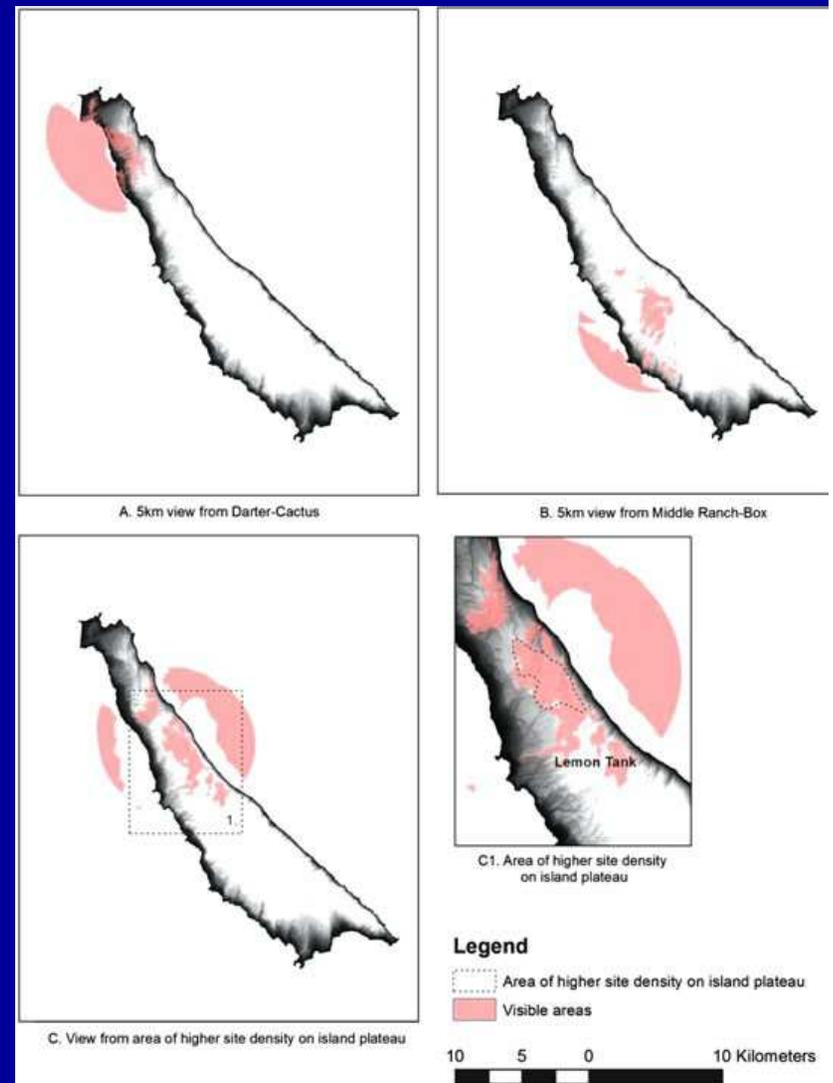

Cost surface: energy expenditure increases from light yellow to red and then blue

Why are clusters of habitation sites and a cluster of ritual sites located away from sources of food, materials, and water?

Viewshed

- ▶ Ability to see wide areas of ocean
 - Exploit windows of opportunity as pods of sea mammals, logs, and whales pass by
- ▶ Ability to coordinate with those who must mobilize quickly to exploit resources

Faroe Islands Whale Hunting

“This photo was taken from land, while the boats were hunting a group of pilot whales into a fjord. The whales were killed a few minutes later, after swimming on to the beach or near to the beach, where men were waiting. ”

“The hunting is not planned, boats don't go out searching for the whales, it happens when a boat or perhaps a ferry happens to find a group of pilot whales near land, and then they pass the message on and other boats sail out to chase them into the nearest bay or fjord. ”

http://en.wikipedia.org/wiki/File:Whaling_in_the_Faroe_Islands_in_August_2012.JPG

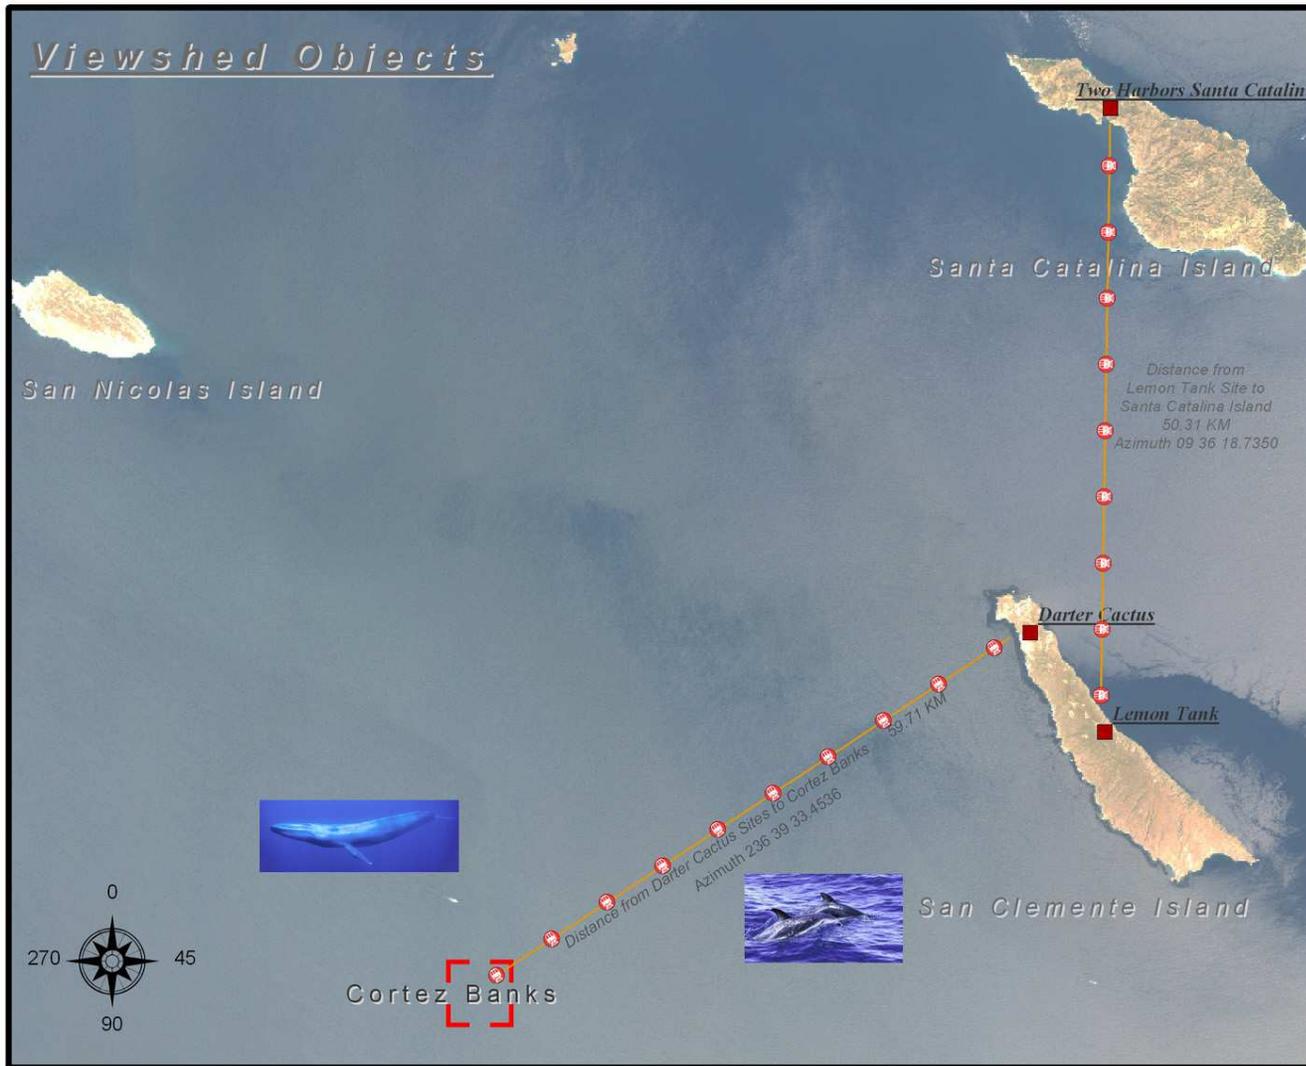

Photos by Eileen Sanda, shared under Creative Commons license

Such opportunist hunting of sea mammals is still practiced today; it is probably similar to practice at SCI. It requires communication and coordination

Mojave Buried Shorelines

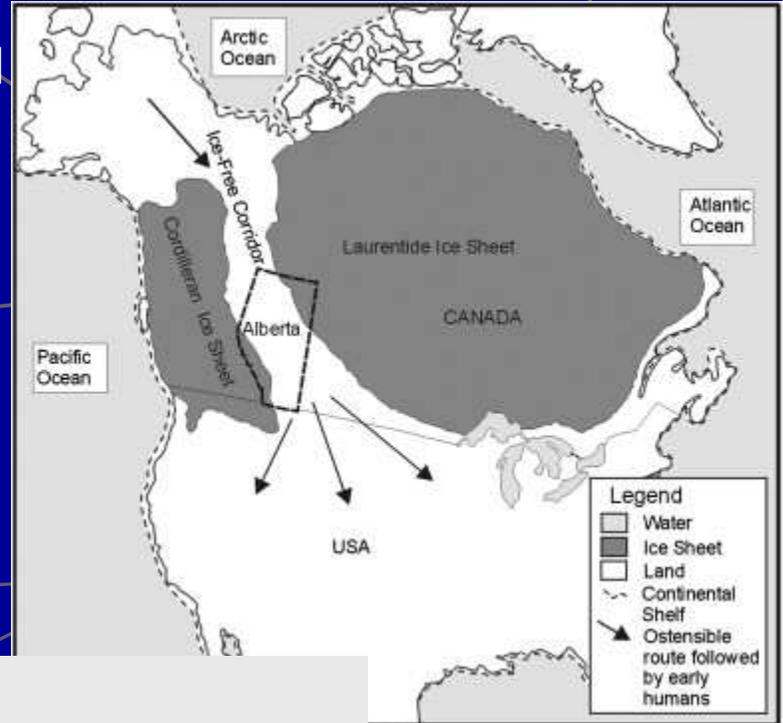

- As glaciers receded, huge lakes formed in the Mojave
- The lakes attracted mega fauna, now extinct
- These in turn attracted some of the human groups that first entered the New World
- We see remnants of these lakes as playa

Clovis Culture

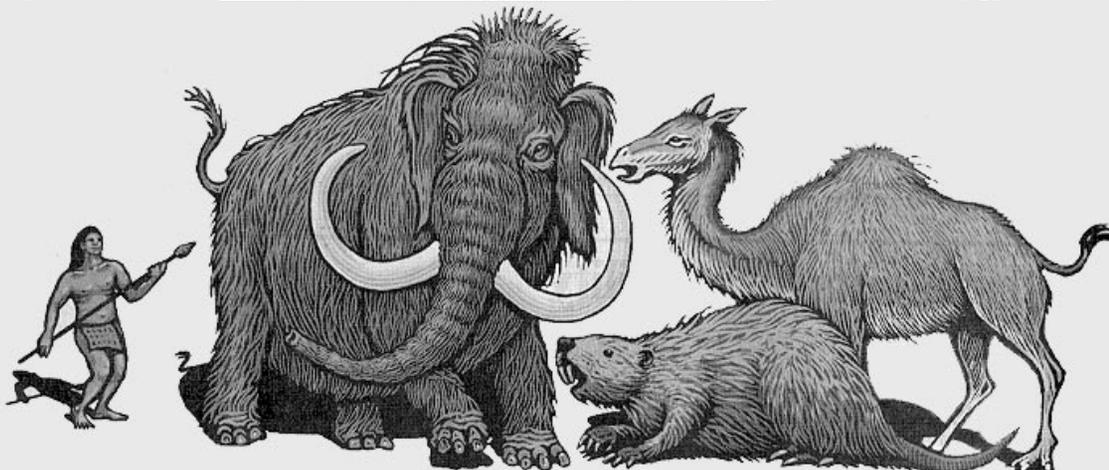

Entered New World over the Bering Land Bridge, then moved south when ice-free corridor formed

Used finely made, specialized tools

Megafauna extinct about 1,000 years after human entry, c. 13,000 B.P.

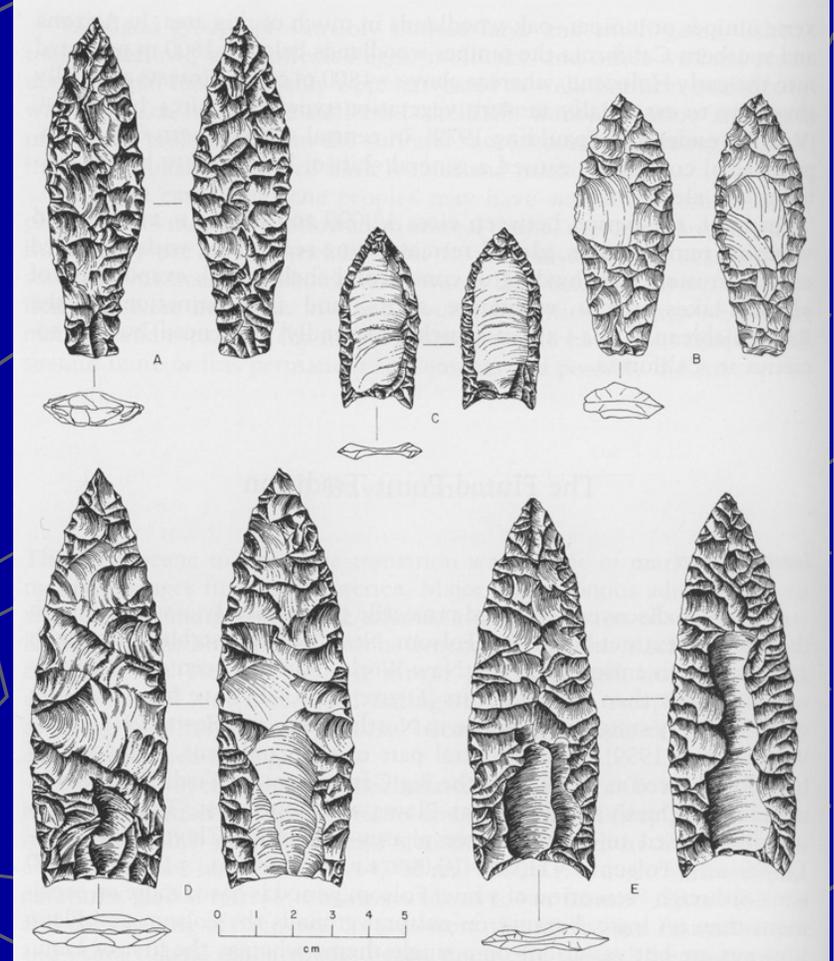

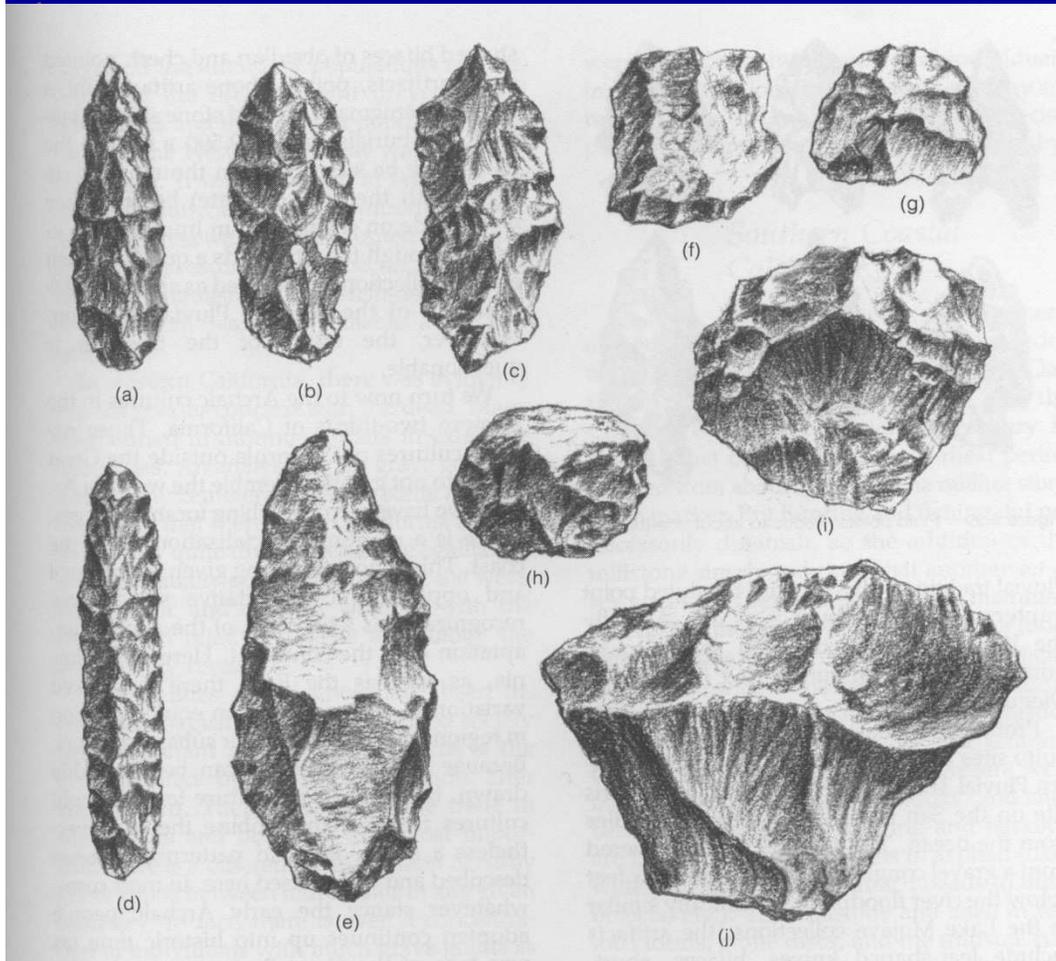

Clovis tools no longer used

Western Stemmed and Clovis

Also known as Western Pluvial, San Dieguito, etc.: 14,300 -8,000 B.P

Fluted points, 13,500-10,000 B.P. (includes Folsom)

Were these used by the first humans to enter the New World?

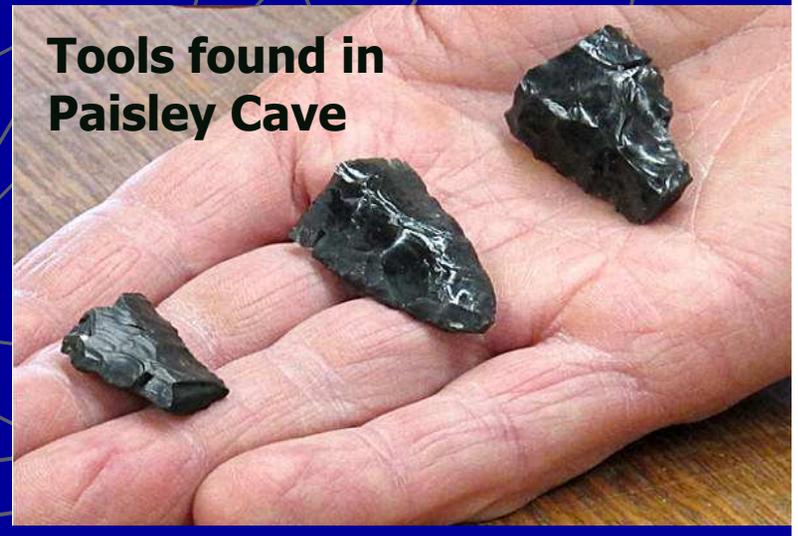

Kelp Highway

- ▶ in *Quaternary Science Reviews*, however, is evidence in the form of pollen and charcoal from soil cores in deep water within three lakes on Sanak Island in the Aleutians, which suggests that Sanak (and perhaps the corridor into the American continents) was ice free by **17,000** years ago.
- ▶ Stone tools found in Paisley Cave, Oregon, with a very reliable date of 14,300 before the present.

Interestingly, early dates for human occupation on San Clemente and all other Channel Islands

Tools found in Paisley Cave

UAVSAR Data Search

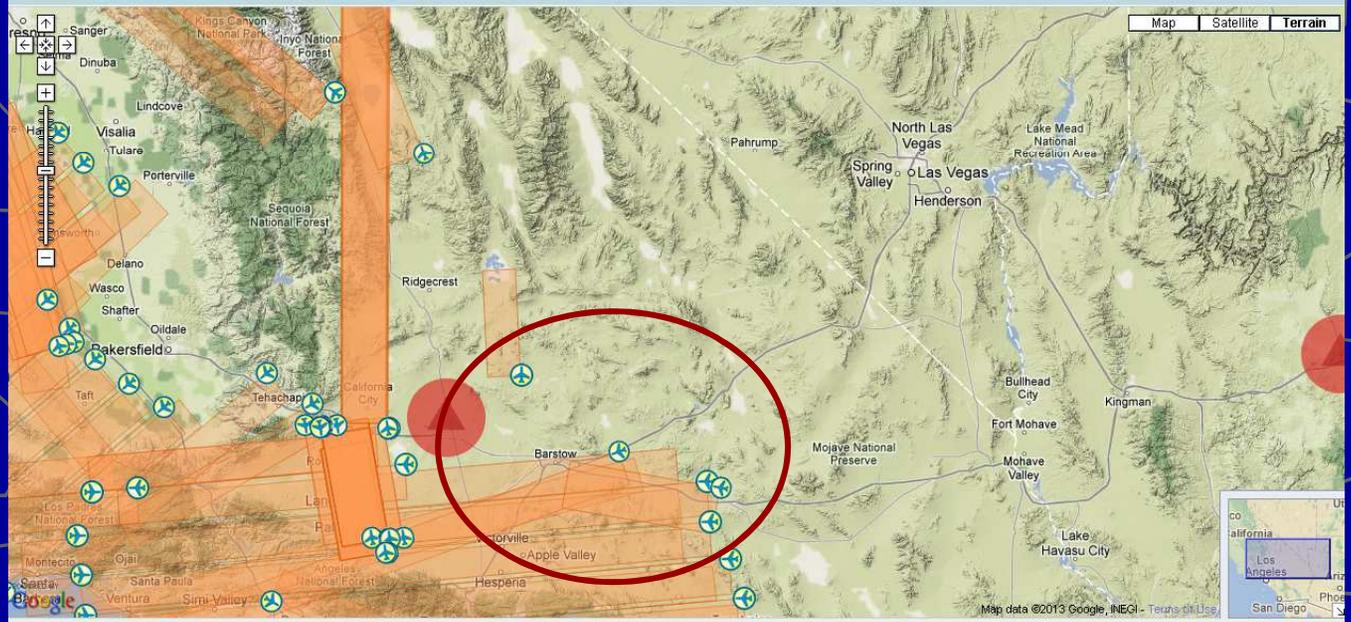

Map Search (Switch to Text search)

You can search by **flight ID**, **line ID**, **line sitename**, **line description**, and **date of acquisition** (in YYMMDD format). Only flight IDs can be searched as a range (e.g. "09001-09035"). To search multiple criteria using OR, separate your search with commas (e.g. "San Andreas, 28532"). To search multiple criteria using AND, separate your search with period (e.g. "Haiti, 11042"). To search multiple criteria using NOT, separate your search with exclamation mark (e.g. "Haiti! 11042").

In the map, click on the **download icons** to download the data.

Total Number of flightlines with data on the map: 586

Just Published: PALSAR Fusion with WV-2

- ▶ The data fusion method used in this study is the Principal Component (PC) spectral sharpening algorithm ([Welch and Ahlers, 1987](#)). It is a popular data fusion method and normally used to sharpen a low resolution multi-band image with a high resolution panchromatic band. The optical WorldView-2 multi-band data acquired on October 14, 2010 was fused with the ALOS/PALSAR L-band image acquired in HH mode on September 17, 2008. Before fusing the data sets, the PALSAR data were filtered using the refined Lee filter method with a 3×3 window size. The data were also interpolated from the original 12.5 m spatial resolution to 0.5 m and co-registered to the WorldView-2 panchromatic data. A color composite of the fused SAR/WorldView-2 bands 7, 4, 3 displayed as RGB rendered the best color contrast, as shown in [Fig. 4](#).

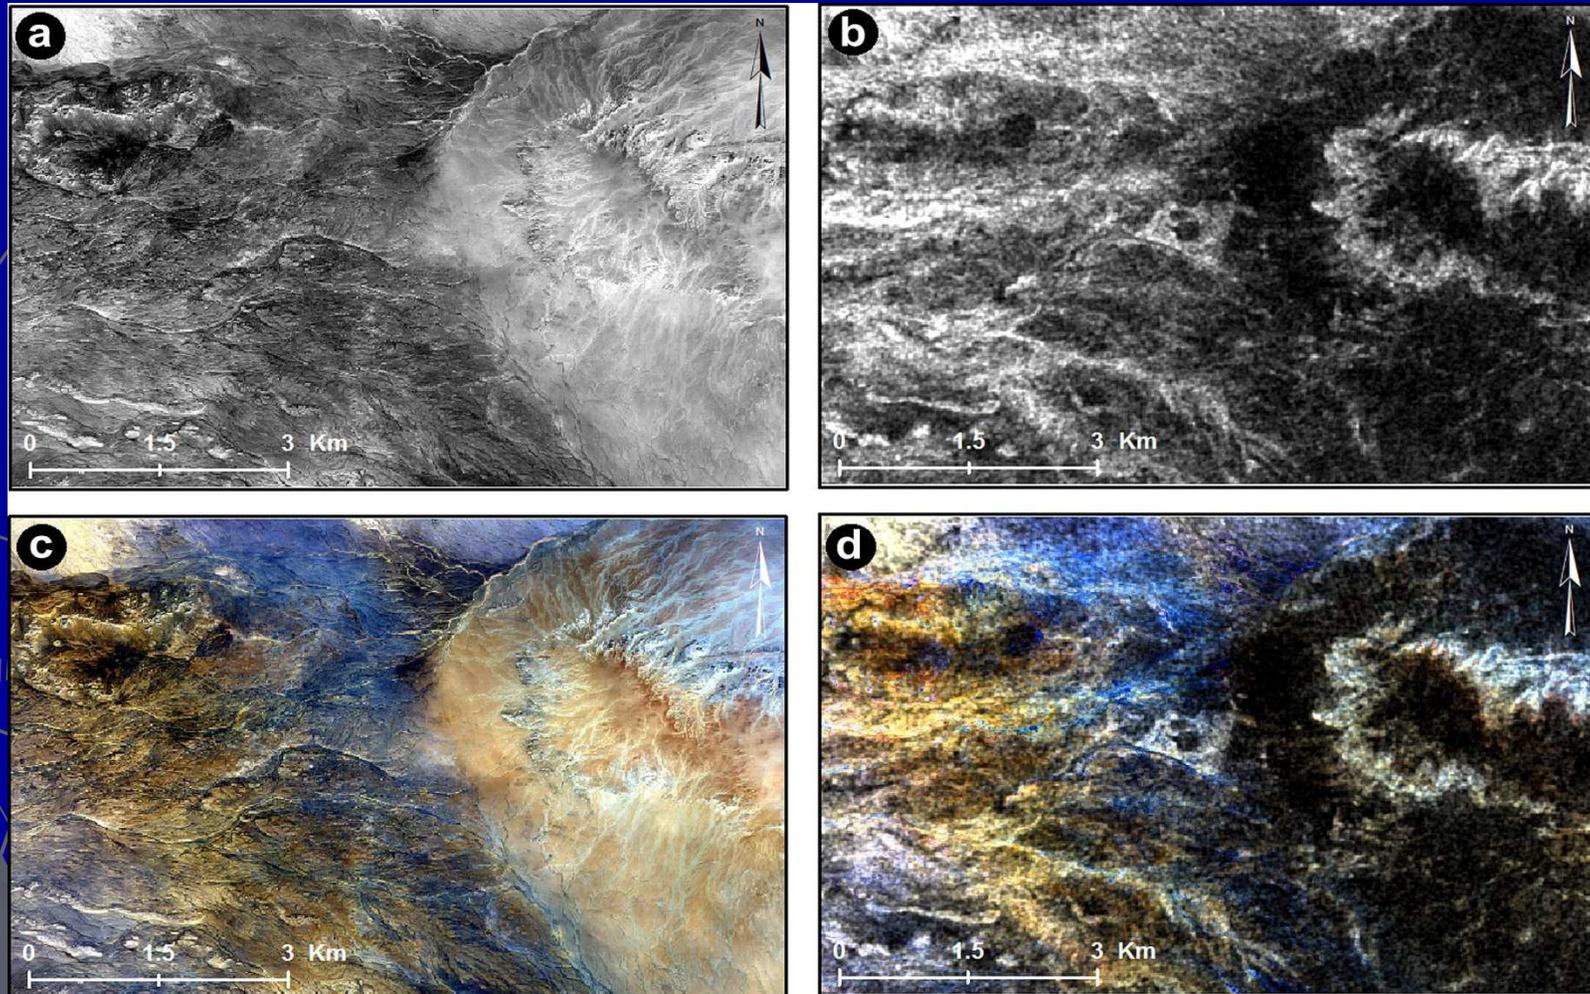

Fig.74 (a) & (c) are the WorldView-2 panchromatic and multi-band (7, 4, 3) data, respectively, (b) is the resampled ALOS/PALSAR data and (d) is the hybrid WorldView-2/PALSAR.
